

# DoubleDisk Converter™

**WHAT THE DoubleDisk™ WILL DO:** Your DoubleDisk™ will not add any capacity or function to your computer. What the DoubleDisk™ will do is allow your present 1.44 MB 3+ inch drive to accept 720 KB disks and use them as 1.44 MB disks. You will experience a cost savings of anywhere from \$3.00 to \$6.00 every time you use your DoubleDisk™.

**HOW DoubleDisk™ WORKS:** There is no difference between the media contained in today's 720 KB and 1.44 MB disks. The only difference between the disks is a small rectangular sense hole in the corner of the 1.44 MB disk, opposite the write-protect slider. The DoubleDisk™ punches this sense hole safely, conveniently, and with extreme accuracy.

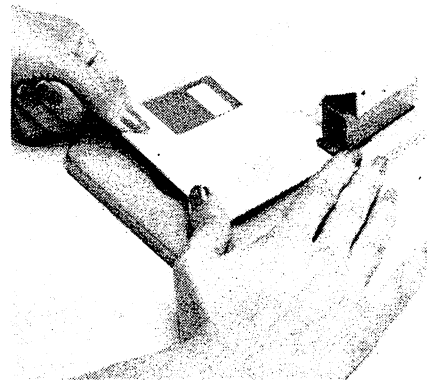

Fig. 1

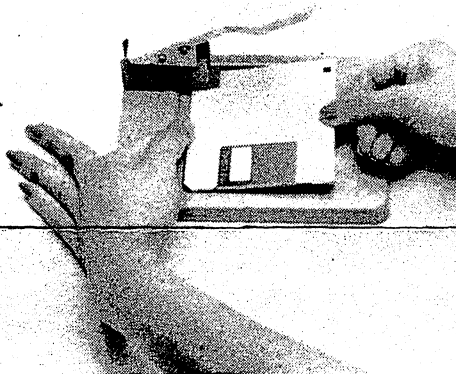

Fig. 2

**OPERATING INSTRUCTIONS:** The conversion process is extremely simple. Before inserting the unconverted disk into your DoubleDisk™, lift the handle gently to insure that the punch is in the full upright position. Insert the disk, *face up*, with the punch positioned over the top corner of the disk opposite the corner with the write-protect slider. The top edge of the disk will be directly under the punch handle, and the disk read slider will be to the left. [See fig. 1]. Then, press down the handle firmly and release. The handle will return to its full upright position. Lift gently once again to insure that the punch has cleared the disk. Then remove the converted disk by lifting it at the disk read slider and sliding from the rear of the punch. [See fig. 2].

**IS THERE ANY DIFFERENCE BETWEEN CONVERTED DISKS AND FACTORY 1.44 MB DISKS?** NO!! We have carefully researched all major brands of Double Sided High Density disks. We obtained specifications from the manufacturers and also subjected disks to independent laboratory analysis. In every case we found the media absolutely identical. Most manufacturers will admit that the media is identical, but claim that HD disks are subjected to a higher level of testing, for which they justify the much higher cost. We found that the difference in testing is immaterial to the quality of the disks. There is a greater variation in the specifications between manufacturers, than in the specifications between DD and HD disks. In fact, the specifications from some manufacturers for their DD disks are actually *higher* than the specifications of other nationally advertised HD disks. What this means is that you can use disks converted with DoubleDisk™ with the confidence that your data will be as safe as if you had used a factory 1.44 MB disk. You save hundreds of \$\$\$\$\$. You sacrifice nothing.

**FULL ONE-YEAR WARRANTY.** If your DoubleDisk Converter™ should fail for any reason within *one year* from your date of purchase, simply return it to us, together with proof of purchase. We will immediately send you a new DoubleDisk Converter™.
